Introduction to IGV The Integrative Genomics Viewer

Malachi Griffith, Obi Griffith, Fouad Yousif Informatics for RNA-seq Analysis July 10-12, 2017

Visualization Tools in Genomics

 there are over 40 different genome browsers, which to use?

- depends on
 - task at hand
 - kind and size of data
 - data privacy

HT-seq Genome Browsers

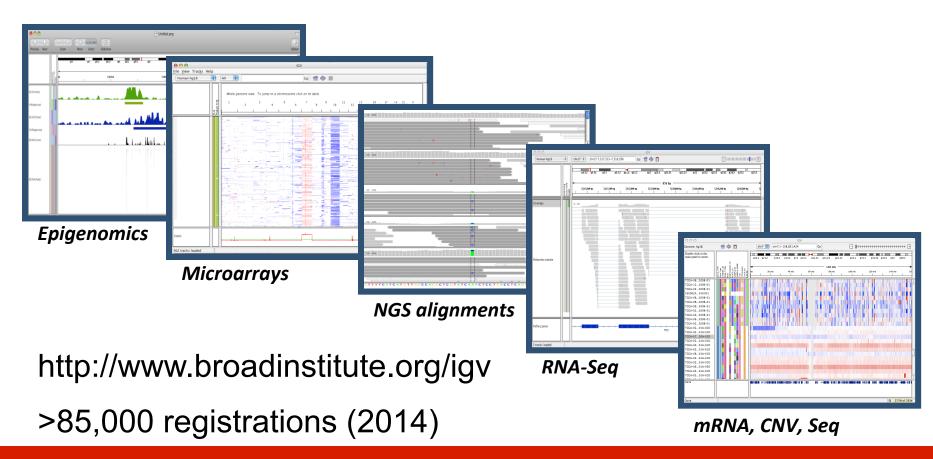

itegrative UCSC Genome Genome Browser Viewer Cancer Genome Browser Trackster (part of Galaxy)

Savant Genome Browser

- task at hand: visualizing HT-seq reads, especially good for inspecting variants
- kind and size of data: large BAM files, stored locally or remotely
- data privacy: run on the desktop, can keep all data private
- UCSC Genome Browser has been retro-fitted to display BAM files
- Trackster is a genome browser that can perform visual analytics on small windows of the genome, deploy full analysis with Galaxy

Integrative Genomics Viewer (IGV)

Desktop application for the interactive visual exploration of integrated genomic datasets

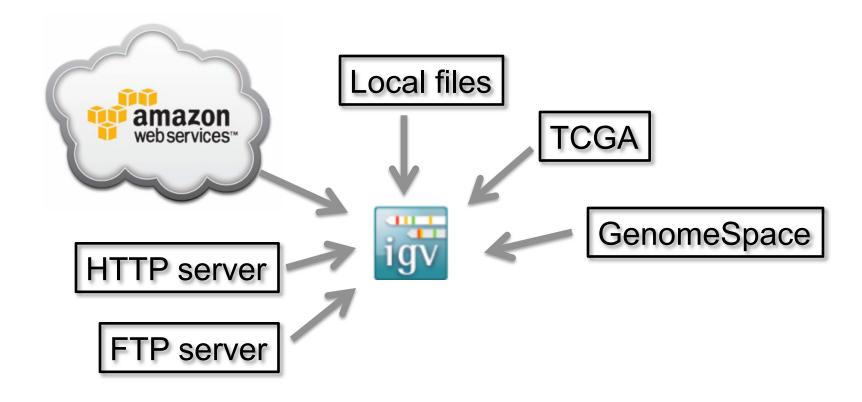

Features

With IGV you can...

- Explore large genomic datasets with an intuitive, easy-touse interface.
- Integrate multiple data types with clinical and other sample information.
- View data from multiple sources:
 - local, remote, and "cloud-based".
- Automation of specific tasks using command-line interface

IGV data sources

- View local files without uploading.
- View **remote** files without downloading the whole dataset.

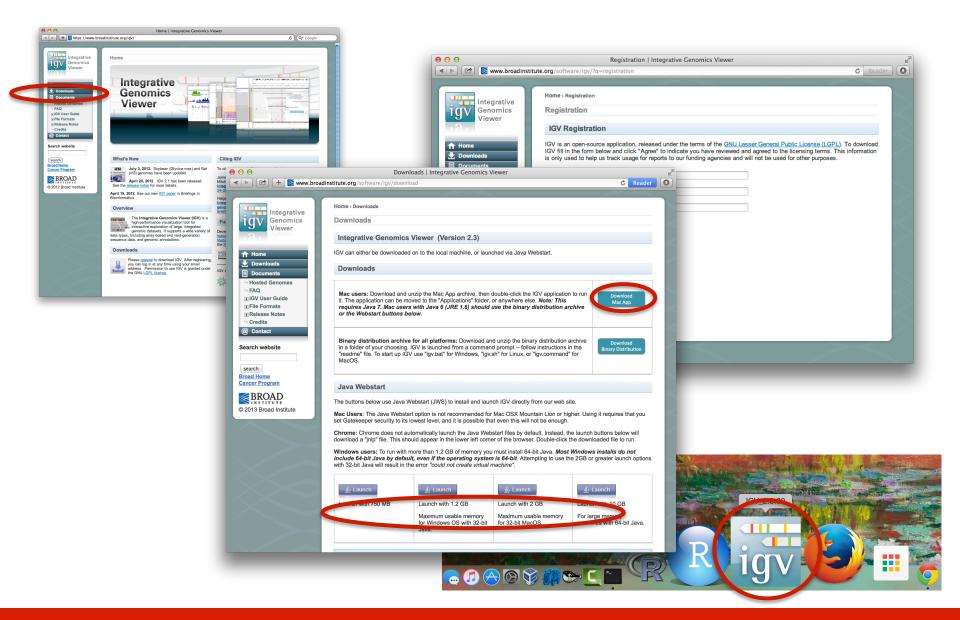

Using IGV: the basics

- Launch IGV
- Select a reference genome
- Load data
- Navigate through the data
 - WGS data
 - SNVs
 - structural variations

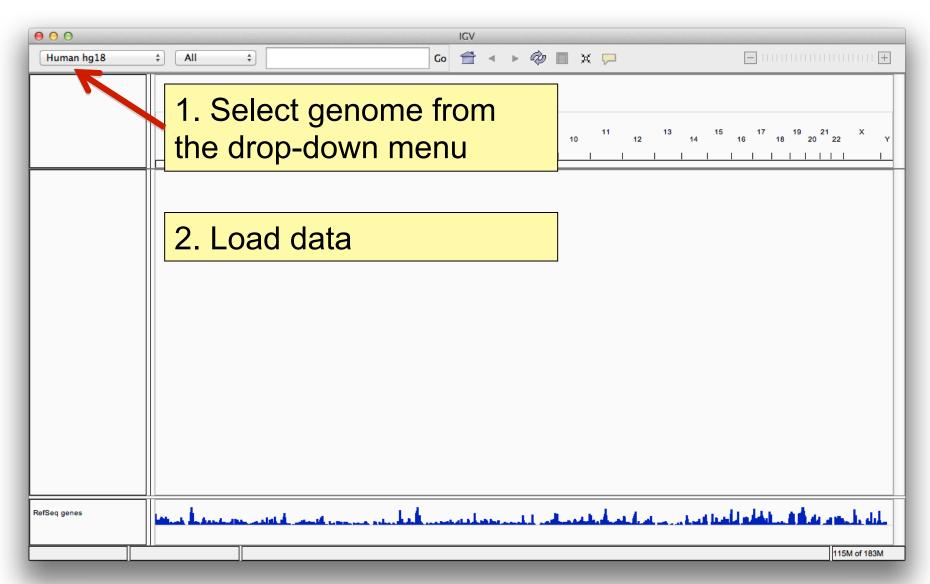

Launch IGV

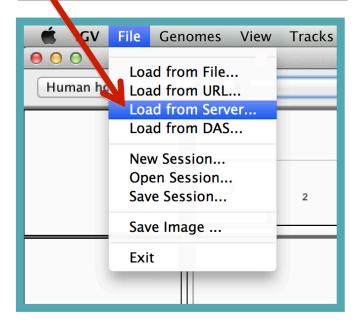

Launch IGV

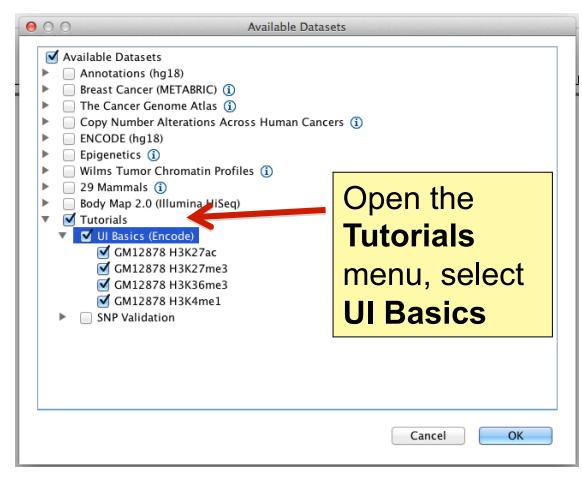

Load data

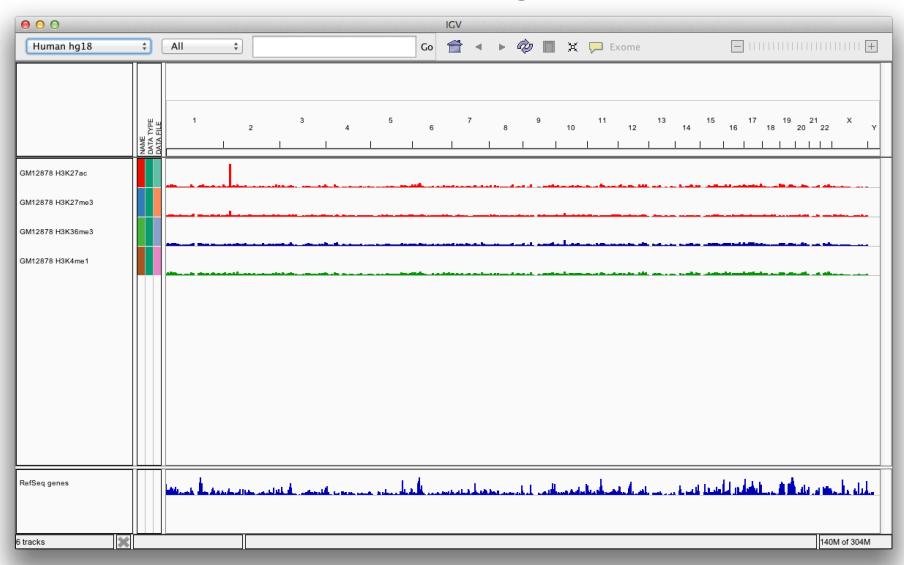

Select File > Load from Server...

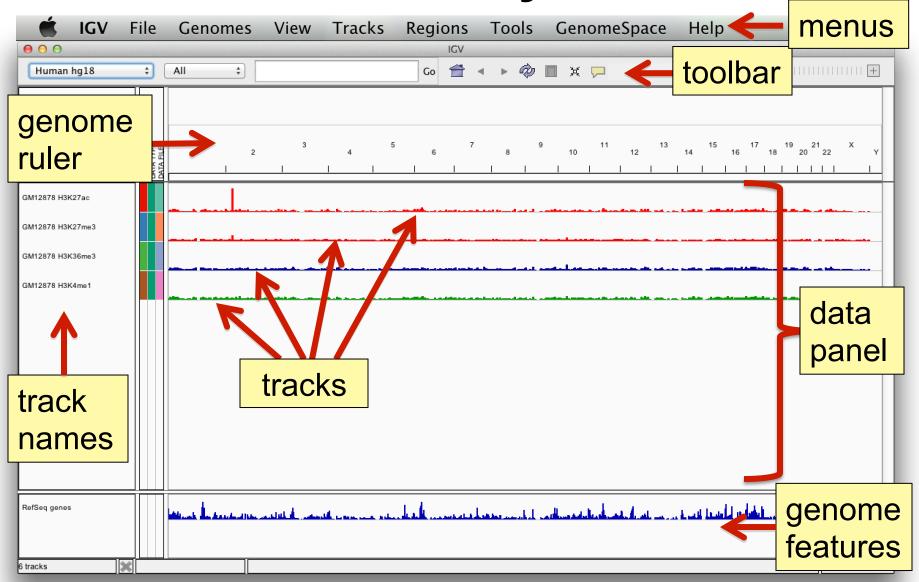

Screen layout

Screen layout

File formats and track types

- The file format defines the track type.
- The track type determines the display options

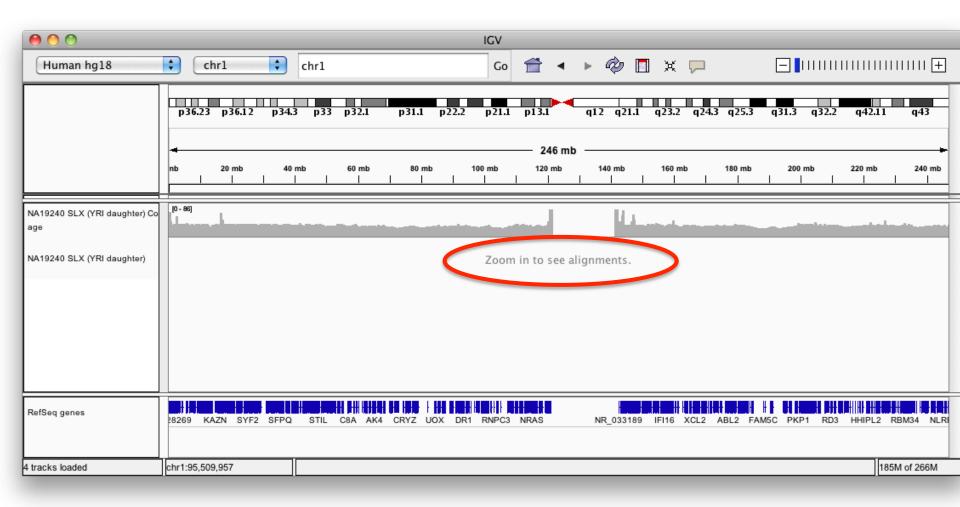

■ BAM	■ <u>IGV</u>
■ BED	■ <u>LOH</u>
 BedGraph 	■ MAF
bigBed	 Merged BAM File (.bam.list)
bigWig	■ MUT
 Birdsuite Files 	■ PSL
■ CBS	■ RES
■ <u>CN</u>	■ SAM
 Cufflinks Files 	 Sample Information
 Custom File Formats 	■ <u>SEG</u>
 Cytoband 	■ SNP
■ FASTA	■ TAB
■ GCT	■ TDF
genePred	 Track Line
■ GFF	■ Type Line
■ GISTIC	■ VCF
■ Goby	■ WIG
- CMAS	

For current list see: <u>www.broadinstitute.org/igv/FileFormats</u>

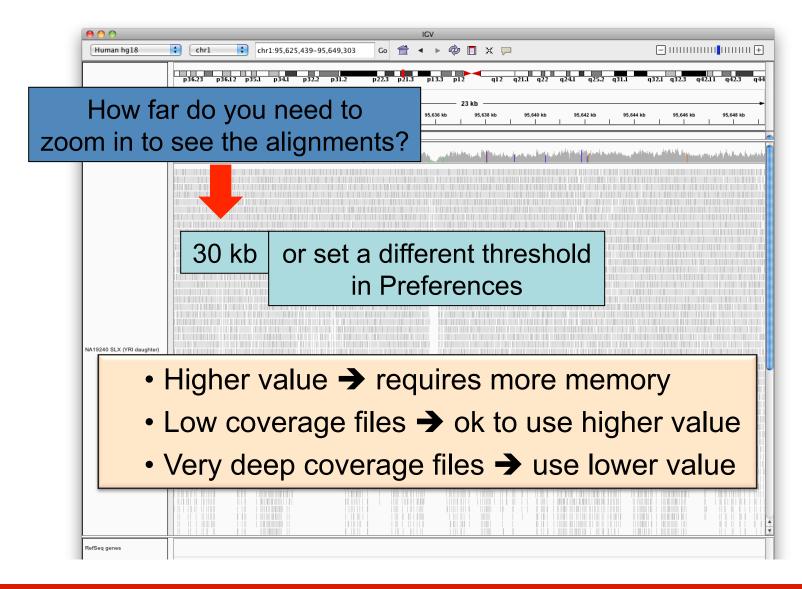

Viewing alignments

Viewing alignments – Zoom in

Viewing alignments – Zoom in

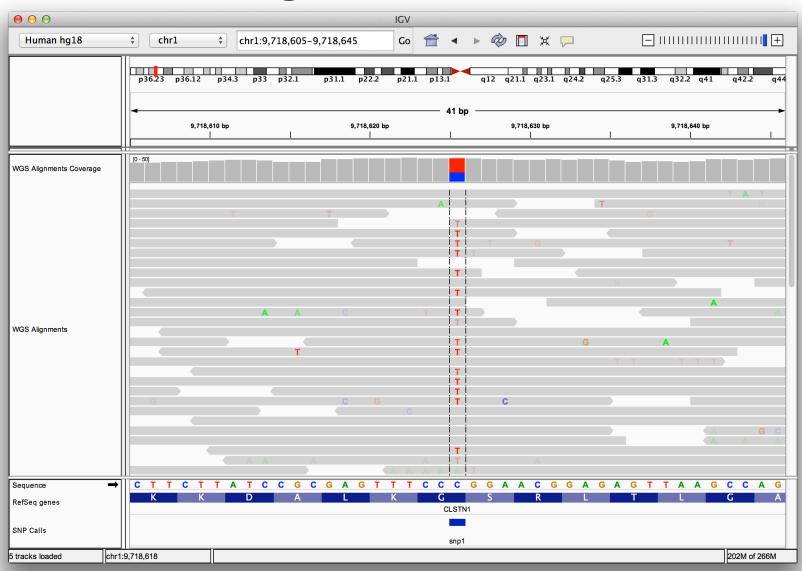

SNVs and Structural variations

- Important metrics for evaluating the validity of SNVs:
 - Coverage
 - Amount of support
 - Strand bias / PCR artifacts
 - Mapping qualities
 - Base qualities
- Important metrics for evaluating SVs:
 - Coverage
 - Insert size
 - Read pair orientation

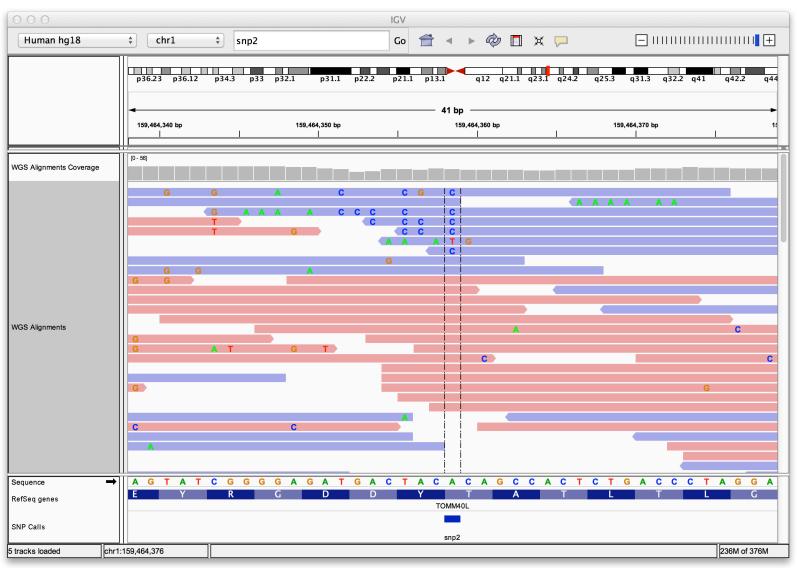

Viewing SNPs and SNVs

Viewing SNPs and SNVs

Viewing Structural Events

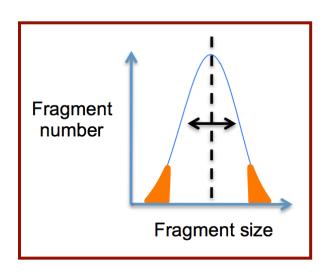

- Paired reads can yield evidence for genomic "structural events", such as deletions, translocations, and inversions.
- Alignment coloring options help highlight these events based on:
 - Inferred insert size (template length)
 - Pair orientation (relative strand of pair)

Paired-end sequencing

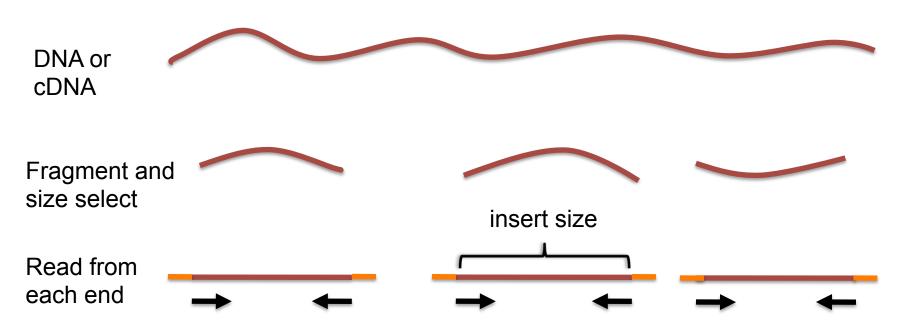

DNA or cDNA

Fragment and size select

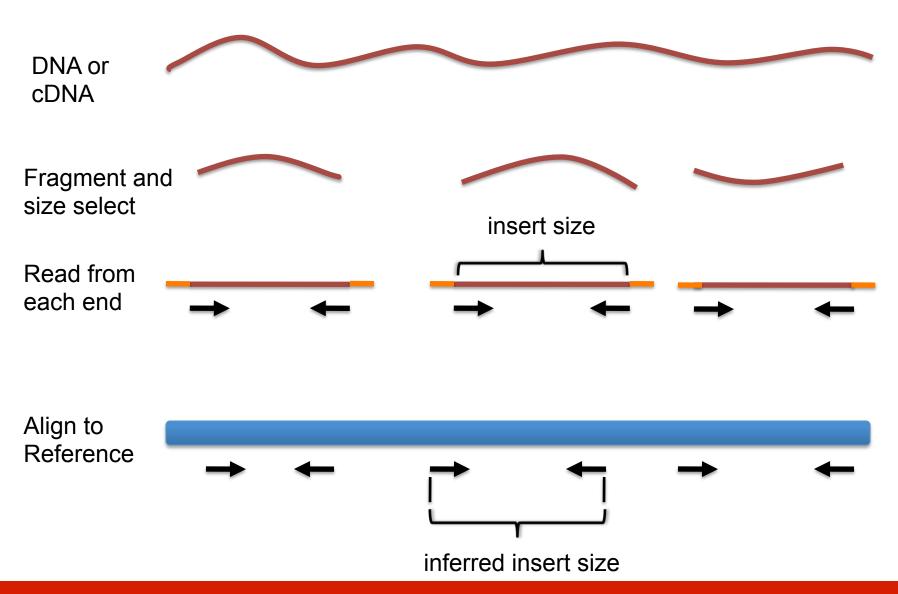

Paired-end sequencing

Paired-end sequencing

Interpreting inferred insert size

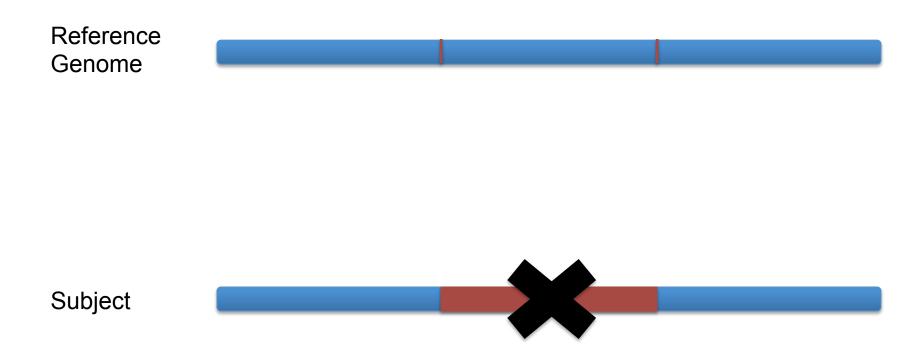

The "inferred insert size" can be used to detect structural variants including

- Deletions
- Insertions
- Inter-chromosomal rearrangements: (Undefined insert size)

What is the effect of a deletion on inferred insert size?

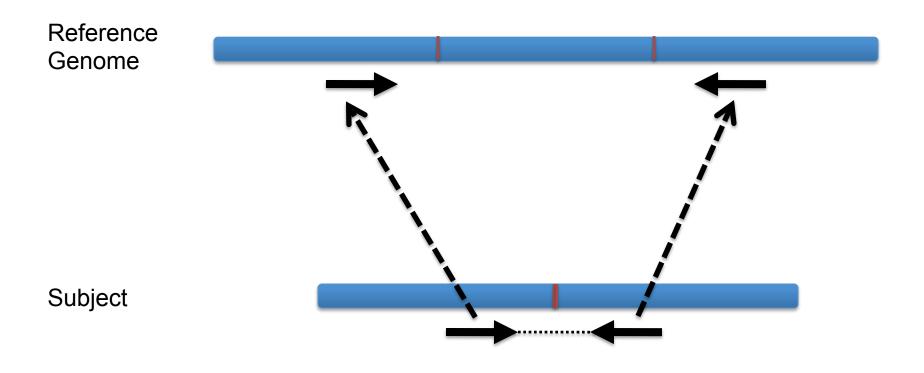

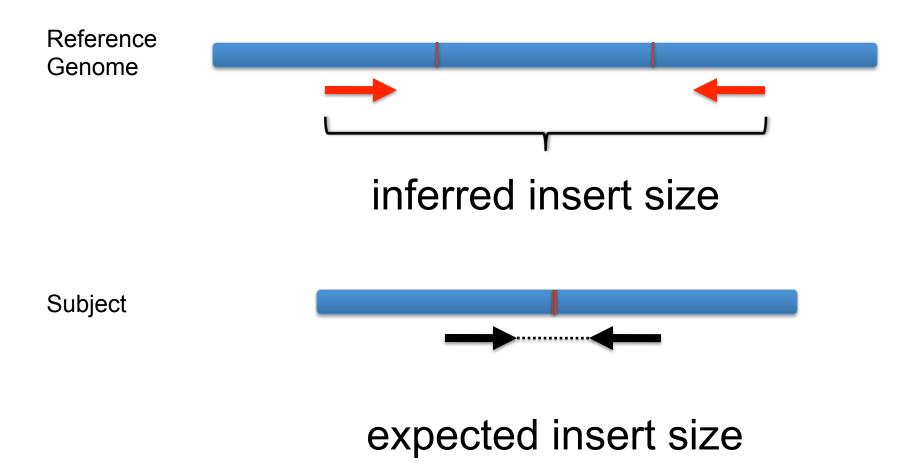

Inferred insert size is > expected value

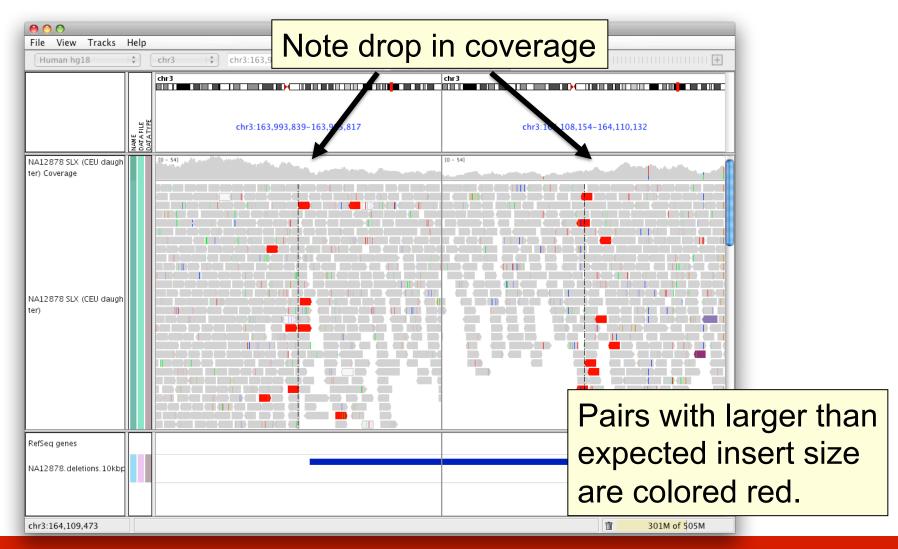

Color by insert size

Insert size color scheme

Smaller than expected insert size:

Larger than expected insert size:

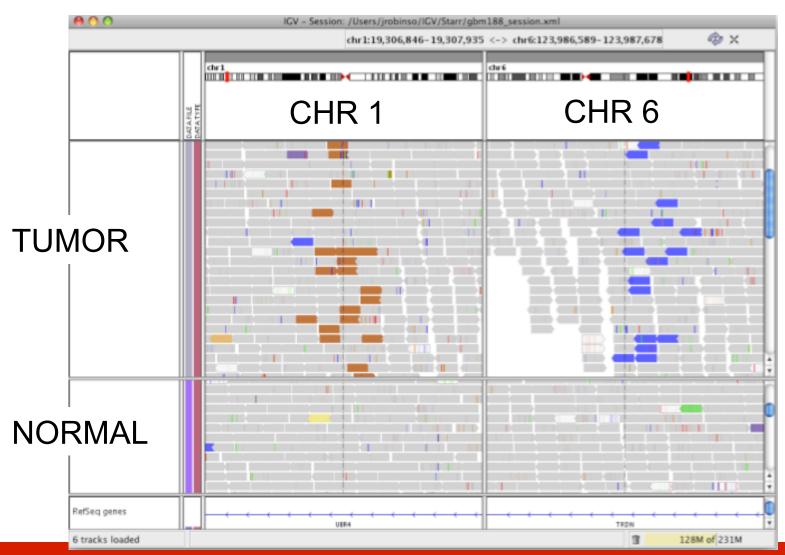

Pairs on different chromosomes

Each end colored by chromosome of its mate

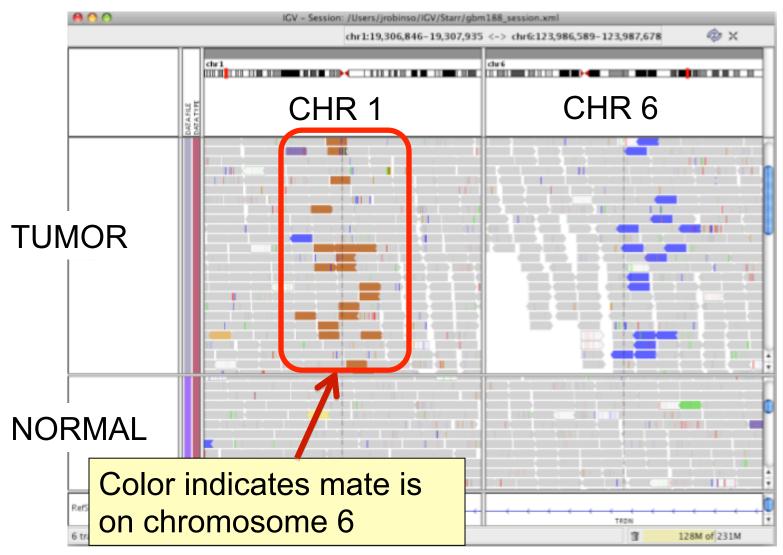

Rearrangement

Rearrangement

Interpreting Read-Pair Orientations

Orientation of paired reads can reveal structural events:

- Inversions
- Duplications
- Translocations
- Complex rearrangements

Orientation is defined in terms of

- read strand, left vs right, and
- read order, first vs second

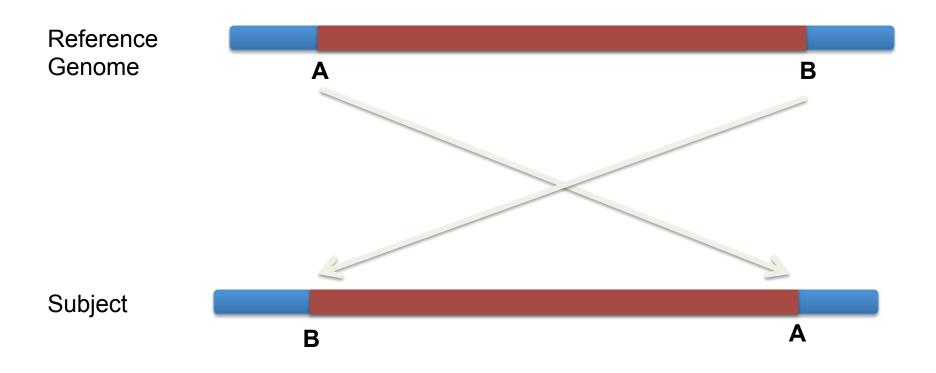

Reference genome

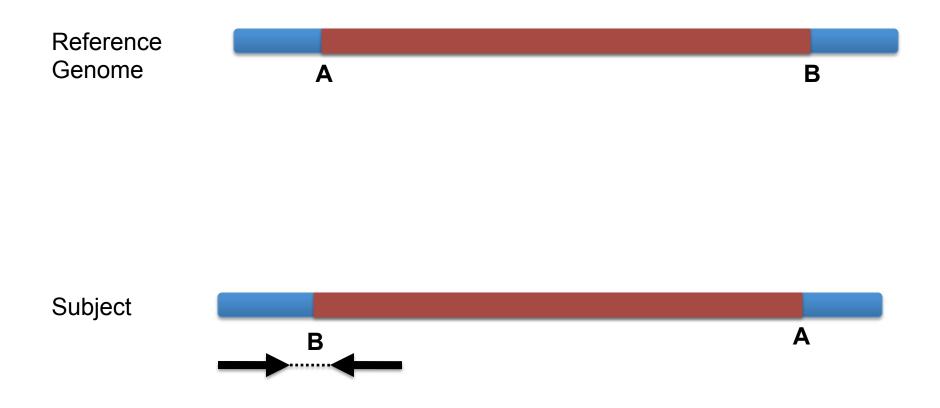

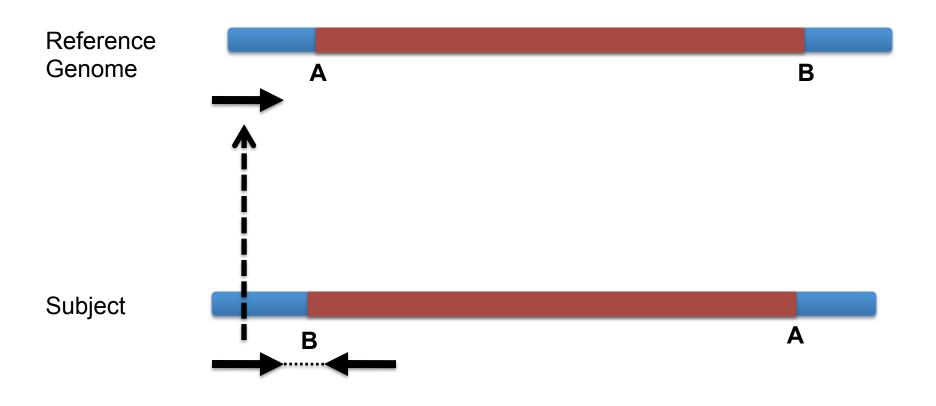

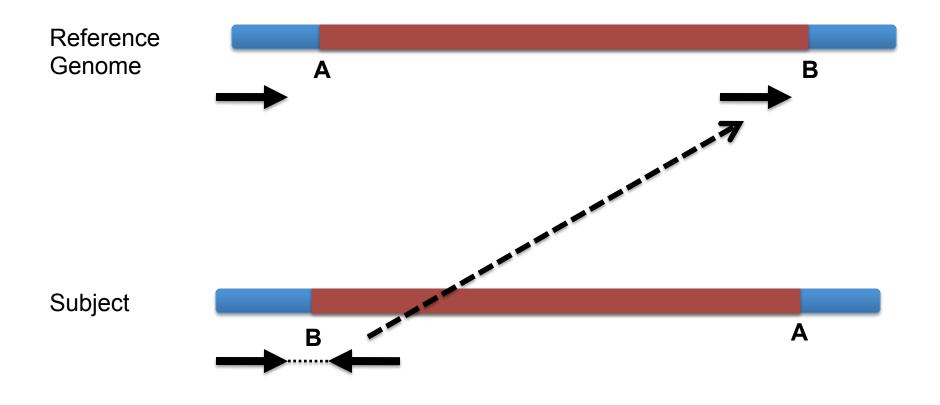

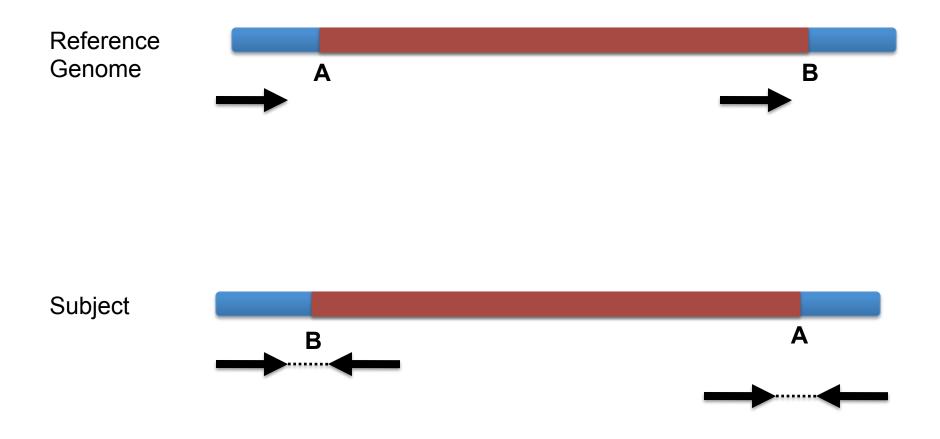

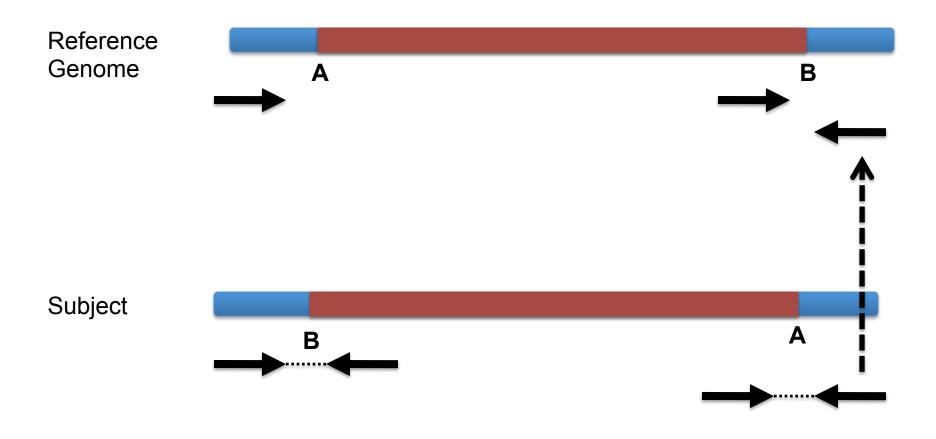

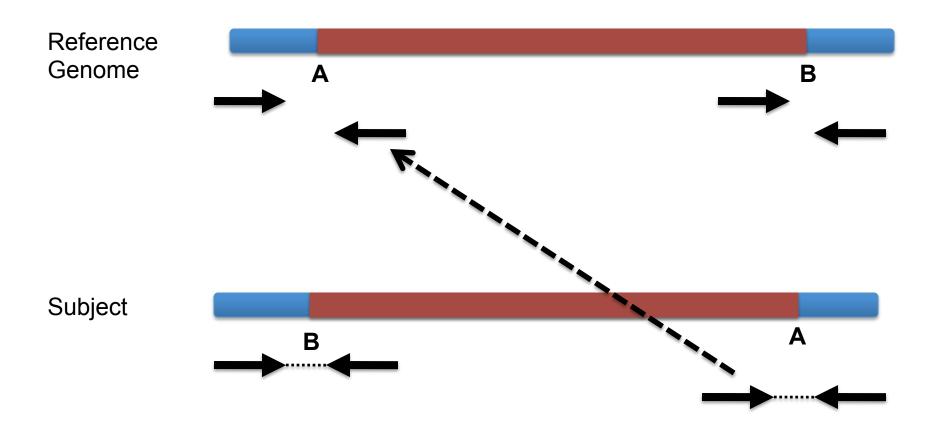

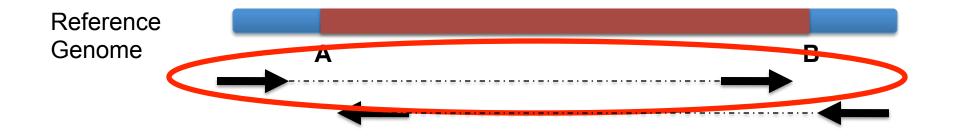

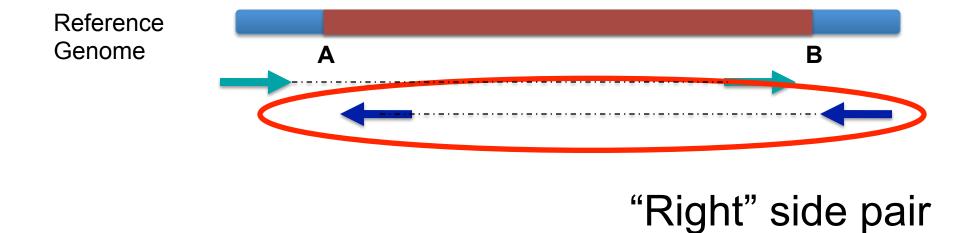

Anomaly: expected orientation of pair is inward facing (→→ →)

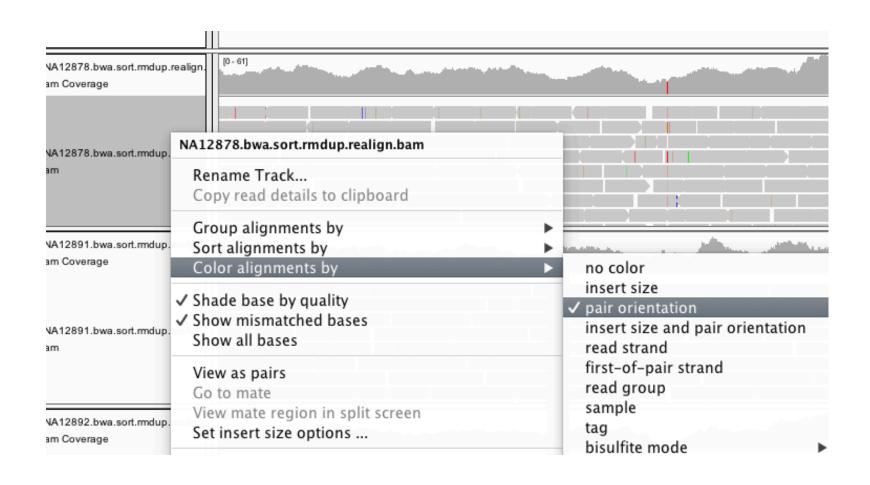

"Left" side pair

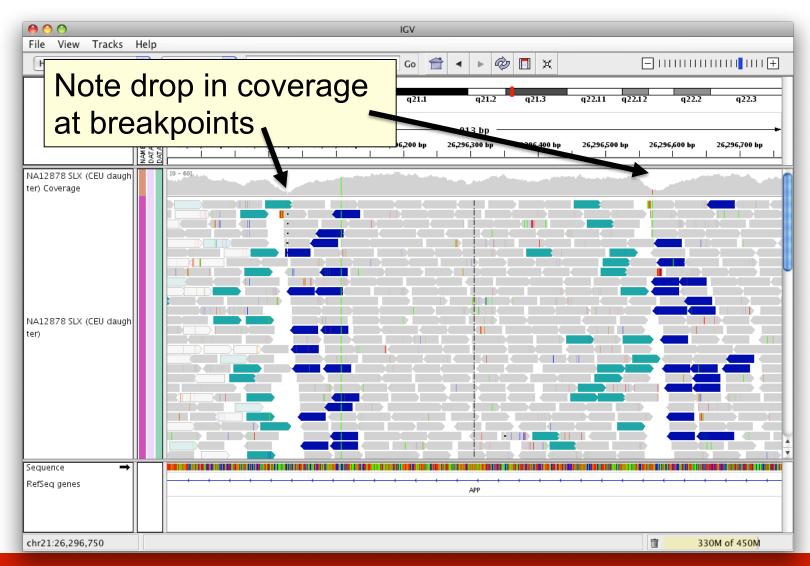

Color by pair orientation

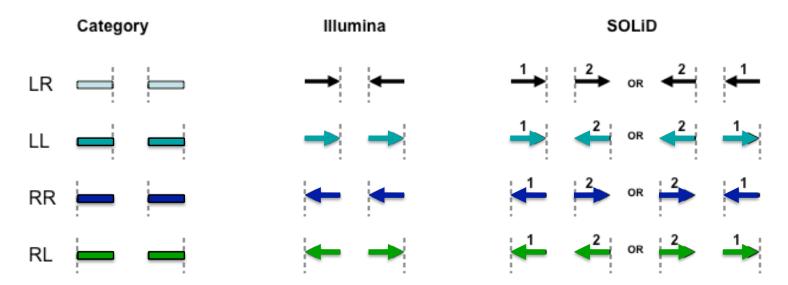

Interpretation of read pair orientations

LR Normal reads.

The reads are left and right (respectively) of the unsequenced part of the sequenced DNA fragment when aligned back to the reference genome.

LL,RR Implies inversion in sequenced DNA with respect to reference.

RL Implies duplication or translocation with respect to reference.

These categories only apply to reads where both mates map to the same chromosome.
