What is a k-mer?

- A fixed sized (***K***) sequence

1-mer

A
C
G
T

2-mer

AA	AC	AG	AT
CA	CC	CG	CT
GA	GC	GG	GT
TA	TC	TG	TT

- A string of length ***N*** contains ***N-K+1*** k-mers

ATTCGACAGTAGCCATGACTGG

...

- One can build *K*-mer index to represent a string

7-mer	iD	N
ATTCGAC	1	1
TTCGACA	2	1
TCGACAG	3	1

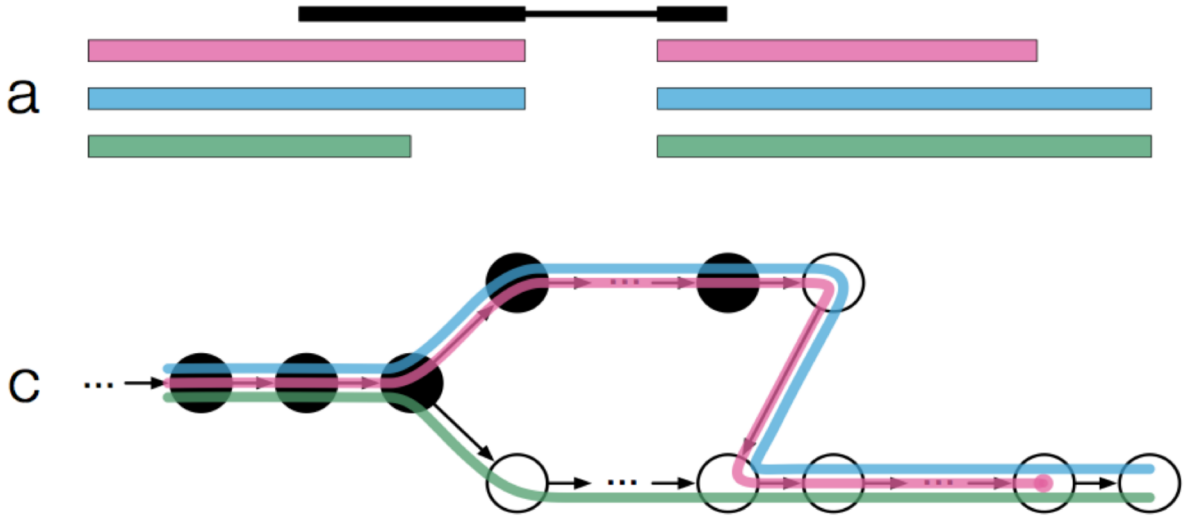
Alignment free approaches for transcript abundance

1. Obtain reference transcript sequences
   - e.g. Ensembl, Refseq, or GENCODE

2. Build a **k-mer index** of all of the k-mers in each transcript sequence
   - Store each k-mer and its position within the transcript. “hashing”

Alignment free approaches for transcript abundance

3. Count number of times each k-mer occurs within each RNAseq read
   - Model relationship between RNA-seq read k-mers and the transcript k-mer index.
   - What transcript is the most likely source for each read?
   - Called “pseudoalignment” , “quasi-mapping”, etc.



Bray, 2016 doi:10.1038/nbt.3519

https://tinyheero.github.io/2015/09/02/pseudoalignments-kallisto.html

4. Handle sequencing errors, isoforms, ambiguity, and determine abundance estimates
   - Transcriptome de Bruijn graphs, likelihood function, expectation maximization, etc.

Advantages/disadvantages of alignment free approaches

- Advantages
  - Very fast and efficient
    - Similar accuracy to alignment based approach but with much, much shorter run time.
  - Do not need a reference genome, only a reference transcriptome

- Disadvantages
  - You don’t get a proper BAM file (though a pseudo-bam can be created)
  - Information in reads with sequence errors may be ignored
  - Limited potential for transcript discovery, variant calling, fusion detection, etc.

Which is best?

- Somewhat controversial …
- https://liorpachter.wordpress.com/2017/08/02/how-not-to-perform-a-differential-expression-analysis-or-science/

- Various sources suggest that Salmon, Kallisto, and Sailfish results are quite comparable

- Usability, documentation, and supporting downstream tools could be used to decide
